

3. Data Standardization

Data standardization was performed to make the dataset consistent and uniform for accurate analysis.

Problem Identified

Some values in the dataset were inconsistent.

Gender Column Issues

Different formats were used for the same values:

- Men
- M
- Women
- W

This created inconsistency in the dataset.

Quantity Column Issues

Quantity values were stored in different formats:

- One
- 1
- Two
- 2

This caused problems during analysis and PivotTable creation.

Steps Performed

Standardizing Gender Column

1. Clicked on the filter dropdown button in the Gender column.
2. Unselected all checkboxes.
3. Selected only:

M

4. Clicked OK.

Used:

Ctrl + F → Replace

5. Replaced:

M → Men

6. Clicked:

Replace All

Repeated the same process for:

W → Women

After replacement:

- Selected all checkbox values again from filter dropdown.
-

Standardizing Quantity Column

Some quantity values were written as text while others were numeric.

Examples:

- One
- Two
- 1
- 2

Used Find & Replace to standardize values:

One → 1

Two → 2

Purpose

This step helped:

- Maintain consistency in the dataset
 - Improve PivotTable accuracy
 - Prevent duplicate category creation
 - Ensure proper dashboard analysis
-

Benefit

After standardization:

- Data became clean and organized
- Analysis became more accurate
- Charts and PivotTables worked correctly
